

WEB SERVICE API

SMDG Work Group

AGENDA

Web Service API Work Group

- Introduction
- Risks & Opportunities for WS API
- Status WS Standardisation
 - SMDG
 - UN/CEFACT
 - DCSA
- SMDG Pilot: Voyage Schedule API

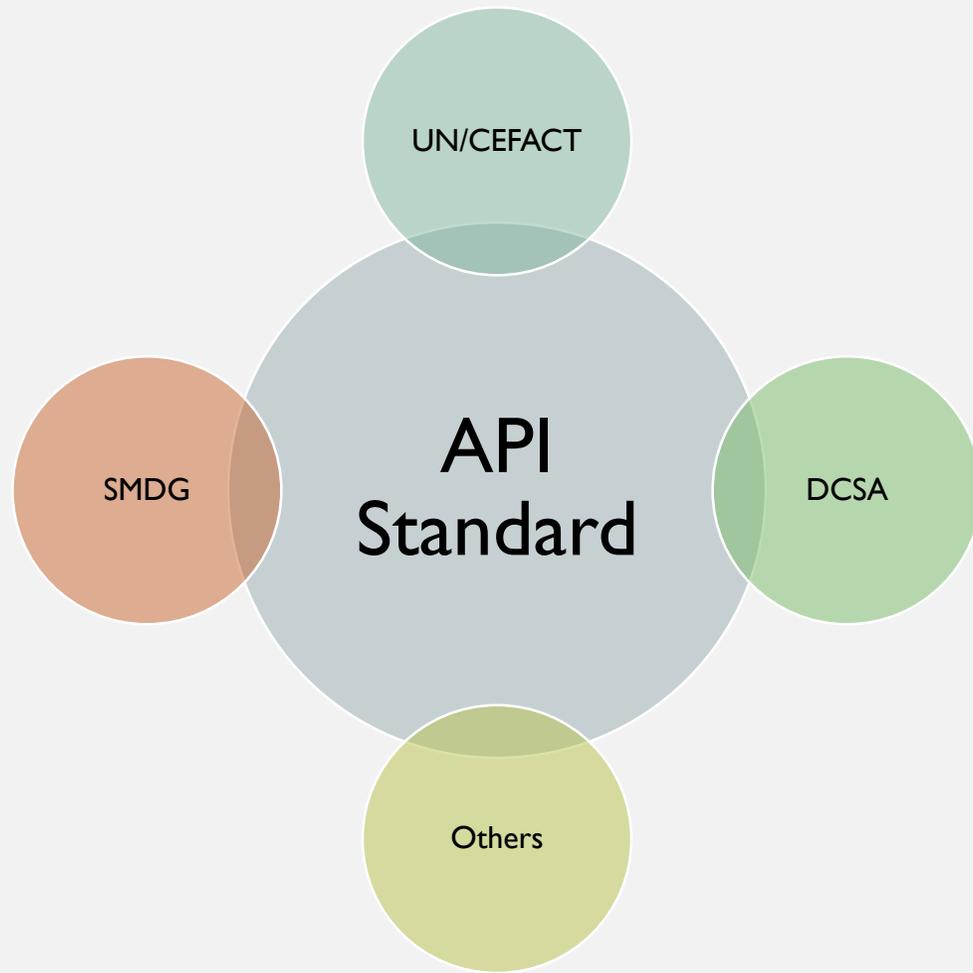

PERSONAL INTRODUCTION

- Tamme Bohlen
- IT Project Manager
- Hapag-Lloyd AG
- Chairman Web Service API Work Group
- UN/CEFACT EDI2API
- DCSA
- MBA at Kühne Logistics University

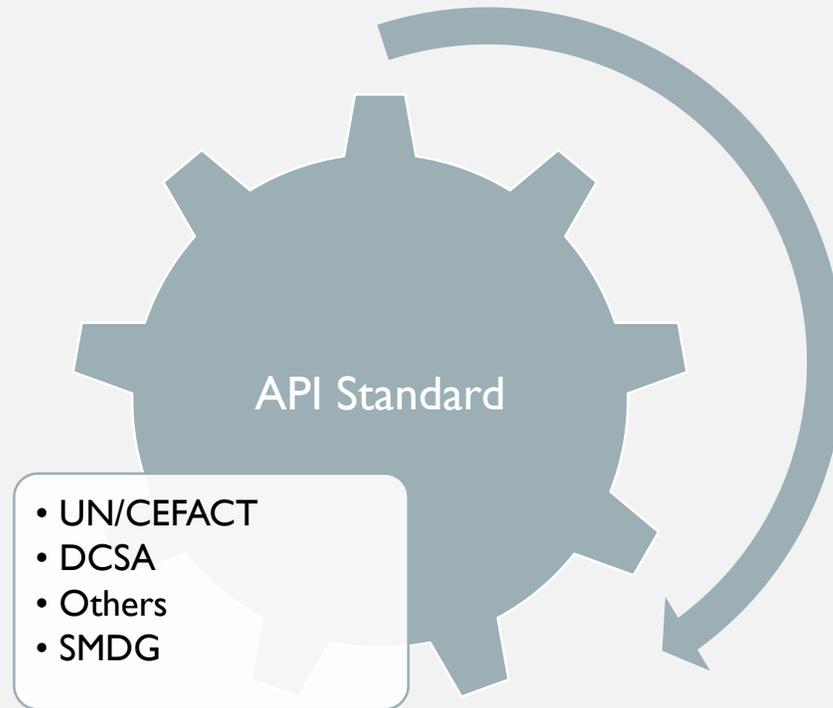

WEB SERVICE API STANDARDISATION ORGANISATIONS

RISK: MULTIPLE STANDARDS

OUR GOAL: ONE STANDARD

HURDLES

- No practical experience with VWS API standards
- No agreed Data Model
- Our industry lacks technical know-how
- Many Software frameworks not ready

UPCOMING HURDLES

NEVER
ENDING
ROAD
WORK

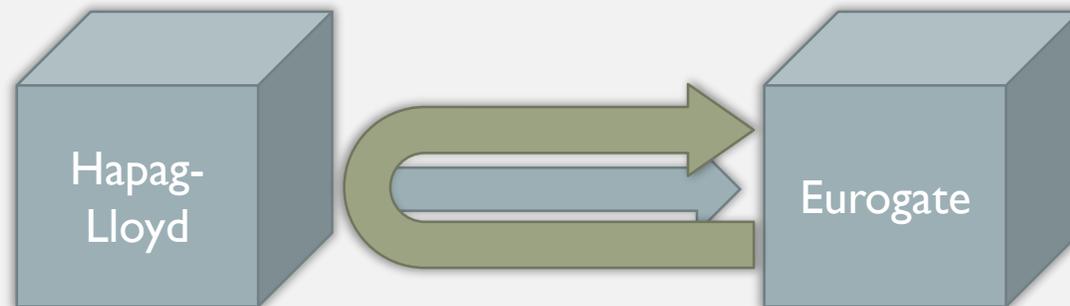

UPCOMING HURDLES

- Requirements and use case identification
 - What does the user need?
- How to implement an API?
 - Effort? (vs. EDIFACT)
- Data model updates
- Agile changes
- Versioning
- Performance
- Security

OPPORTUNITIES

- Synchronous data exchange
- Data on demand
- Direct system integration

→ Example: API Container Announcement

CURRENT STATUS

- SMDG
- UN/CEFACT
- DCSA

STATUS SMDG I

- First technical guideline finished
- First pilot created

- Voyage Schedule API
 - Use-case: Carrier Voyage Schedule for Terminals
 - Goal of first pilot: gather experience, learning by doing

- More to come in the workshop on Thursday!

STATUS SMDG II

Dashboard / ... / Web service API development 3 view(s)

SMDG Web Service Manifest

Created by Bohlen, Tamme, last modified on Jan 10, 2019

Currently in development by HL (@Bohlen, Tamme)

Based on / Credits to [API-Design Guideline](#)

Worldwide Web Service Standard Concept

This is a draft for a technical Web Service concept for the Maritim

Change History:

- added/changed HTTP Status Codes /10.01.2019

- 1 Introduction
 - 1.1 Motivation
 - 1.2 Examples, sources and further reading
- 2 SMDG Internal Web Service Definition Guideline
 - 2.1 Interface Design and Specification
 - 2.2 Security
- 3 SMDG Technical Web Service Guideline
 - 3.1 Stateless design and resources
 - 3.1.1 Stateless Design
 - 3.1.2 REST Resources
 - 3.1.3 Resource types
 - 3.1.4 Representation
 - 3.2 URL patterns
 - 3.3 Naming
 - 3.4 MIME types
 - 3.5 Handling list-resources
 - 3.6 HTTP operations
 - 3.7 Status codes
 - 3.8 Errors
 - 3.9 Link-Headers
 - 3.10 Versioning
 - 3.11 Date / Time ISO8601
 - 3.12 Content Negotiation
 - 3.13 Testing

Errors

Errors **MUST** be in the format described in RFC 7807 with the media types `application/problem+json` or `application/problem+xml`.

Example for an error (application/problem+json)

```
{
  "type": "http://example.de/problem/service-unavailable",
  "title": "service unavailable",
  "status": 503,
  "detail": "Connection to database timed out"
}
```

The format **MAY** be extended so that the API can express all error situations that are needed.

SMDG recommends web service gateways to inject a global transaction ID into every request. This ID can be found in the HTTP header X-Global-Transaction-ID. This ID **MUST** be included in every error response. If a client experiences an error to reason for the error and thus help to improve the API.

◆ An API **MUST NOT** in any way display implementation details to the client.

[→ More information](#)

Link-Headers

In order to enable API users to navigate through associated entities developers are encouraged to create appropriate links.

- When creating an entity the corresponding location **MUST** be sent in the Location header of the HTTP response.

Example Location-Header

- Retrieving entity information **SHOULD** also return a Link header in the HTTP response to refer to associated entities.

Example Link-Header

- When implementing a list resource links **MAY** be used to directly link to listed entities.

[→ More information](#)

Versioning

SMDG recommends versioning via URL. This means that every API URL will contain the version of that specific API.

example

```
https://api.hlag.com/mobile/smdg2/container
```

[→ More information](#)

Date / Time ISO8601

ISO8601 **MUST** be used as the standard date and time format. This format includes date, time and timezone.

It is possible to only use parts of the timestamp format. You **MAY** combine date and time values or just use one if them alone.

2017-06-08T15:49:47.123456789+02:00

Don't use it if you don't need it

ISO 8601 also allows us the flexibility to provide a date without a time. In such cases, you should **return the time**.

While it seems like no harm done in just storing 11:59pm, or some other random time, it is not recommended.

STATUS UN/CEFACT I

- UN/CEFACT Forum in Geneva in April 2019
- Agreed on SMDG Pilot (EDI2API)
- EDIFACT to Web Service API

- Other API Projects:
 - RDM to API
 - API Town plan

STATUS UN/CEFACT II

- [Edi3.org](https://www.edi3.org/) / [GitHub](#) / [Slack](#)
- Why EDI3?
 - EDI1 – EDIFACT
 - EDI2 – XML
 - EDI3 – Web Service API

STATUS DCSA

- More carriers joined the DCSA
- First planned milestone: One API for Tracking
- Focus on data model and industry blueprint
- First publications to come
 - Will be published on dcsa.org
 - Comments are possible directly on the webpage

API TECH AND SMDG PILOT

TECH BEHIND API

- What's an API?
 - EDIFACT vs Web Service
- What's a Web Service API?
 - Based on HTTP
- Which technology & design is connected?
 - Data model
 - Swagger
- Examples
 - SkyScanner
 - Google Flights

SMDG PILOT

- EDIFACT Data Model → Voyage Schedule API

PILOT NO.1: VESSEL SCHEDULE API

- IFTSAI_D11B
 - UNA [0..1]
 - UNB
 - UNG [0..1]
 - UNH
 - BGM
 - DTM [0..9]
 - FTX [0..99]
 - GEI [0..1]
 - Group1 [0..9]
 - Group2 [0..9]
 - Group3 [0..999]
 - Group4 [0..999]
 - Group8 [0..9]
 - Group10 [0..9]

Date/Time

PILOT NO.1: VESSEL SCHEDULE API

```

1 swagger: '2.0'
2 info:
3   title: Voyage Schedule
4   description: >-
5     This API provides the voyage schedules of a carrier. It is based on the
6     UN/CEFACT EDIFACT model. The API will be extended for more use cases.
7   version: 0.1.0
8   host: api.example.com
9   basePath: /transport/v1
10  schemes:
11    - https
12  paths:
13    /voyageSchedules/findByLocation:
14      get:
15        tags:
16          - Schedule
17        summary: Returns a list of Voyage Schedules for a specific location.
18        description: >-
19          Find all voyages for a specific location. Returns an array.</br>
20          <b>Examples:</b></br> <b><i>find voyages for Hamburg,
21          Germany</i></br>
22          /voyageSchedules/findByLocation?locationNameCode=DEHAM </br></br>
23          <b><i>find voyages for Container Terminal Altenwerder in Hamburg,
24          Germany</i></br>
25          /voyageSchedules/findByLocation?locationNameCode=DEHAM&relatedLocationNameCode=CTA
26        produces:
27          - application/json
28        parameters:
29          - name: locationNameCode
30            in: query
31            description: The UN location code (e.g. "DEHAM")
32            required: true
33            type: string
34          - name: relatedLocationNameCode
35            in: query
36            description: The 1st related Location code
37            required: false
38            type: string
39        responses:
40          '200':
41            description: OK
42            schema:
43              type: array
44              items:
45                $ref: '#/definitions/TransportInformation'
46          '400':
47            description: Invalid UN location code and/or related location code supplied
48          '404':

```

Voyage Schedule 0.1.0

[Base URL: api.example.com/transport/v1]

This API provides the voyage schedules of a carrier. It is based on the UN/CEFACT EDIFACT cases.

Schemes

HTTPS

Schedule

GET /voyageSchedules/findByLocation Returns a list of Voyage Schedules

GET /voyageSchedules/findByID/{meansOfTransportJourneyId}

GET /voyageSchedules/findByStartAndDestination Returns a list of location.

Carrier >

WORKSHOP

- Workshop on Thursday
- Goals:
 - Exchange learnings
 - gather requirements for Voyage Schedule API
