

SMDG Keynote: Data Streaming

EDI vs API vs Data Streams

SECTION 01

Why are we even here ?

Communication has changed a lot in the last 100 Years

Morse Code Message

- Structure is crucial
- Medium of exchange is limited

Land Line Telephone Call

- Structure is less important
- Medium for exchange is more important

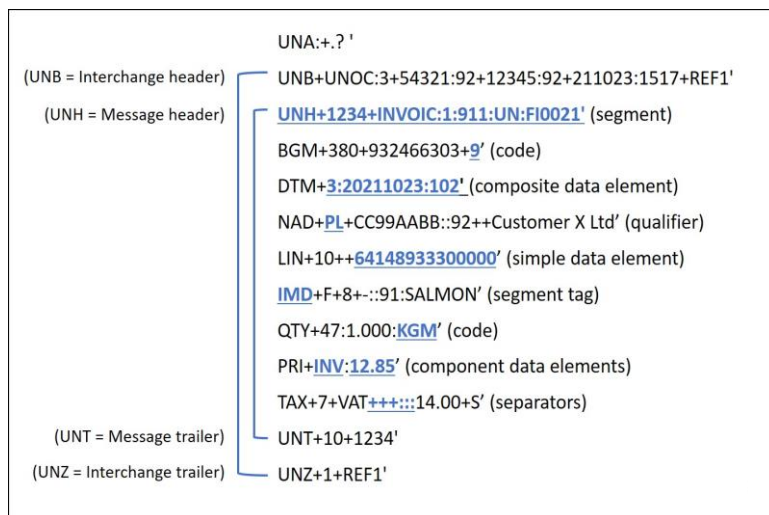

Modern Data Based Communication

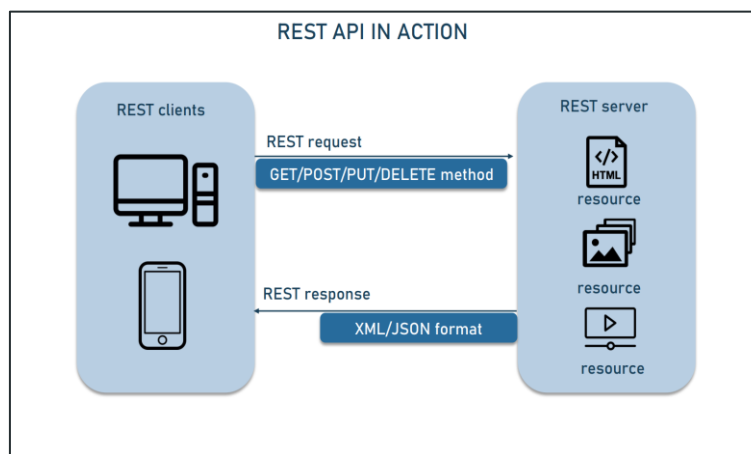

- Structure is almost irrelevant
- Medium of exchange is everything

This is analogous to what we are currently experiencing in the way we communicate

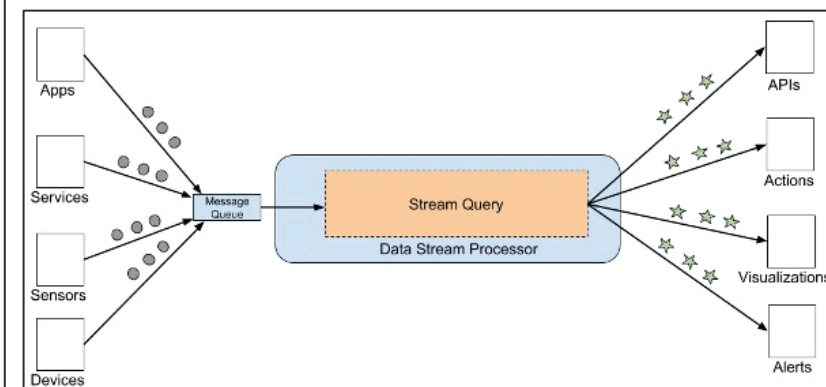

EDI Message

API Call

Modern Stream Communication

So, what exactly is a Stream ?

We need to start with: **What is an EVENT**

An **EVENT STREAM** is a continuous collection of Events

Event Stream **PROCESSING** is the process of taking actions on the events generated

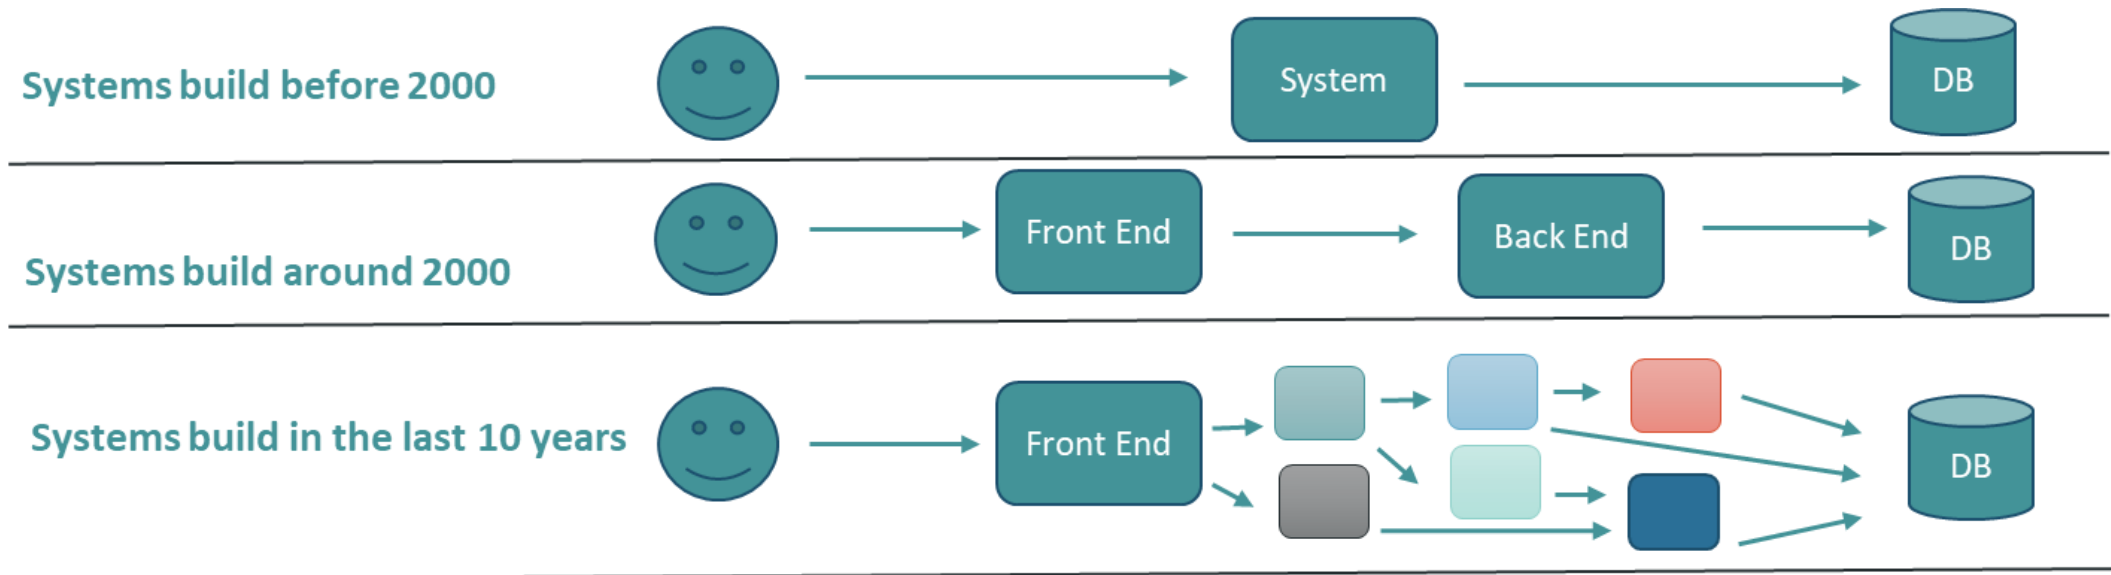

In a system that continuously generates data, each data point refers an Event

Event Streams are also called Data Streams as they consist of continuous stream of data points

- Performing Calculations
- Transforming Data
- Analysing Data
- Enriching Data

Unlike APIs which provide specific information when requested. Streams treat every action and an Event and do not wait for systems or people to request information but rather immediately notify all interested parties every time an Event takes place

Just as Communication has Changed, So has Technology

But this has come with problems and streaming addresses these problems in 3 ways

Transactional Issues

Compounding issue - Isolated performance (reliant on the slowest service)

Stateless – “Get splosion” – can result in many service calls (sub optimal)

Immutability

- Streams are immutable commit logs
- Unchanging over time or unable to be changed
- Can replay data timeline

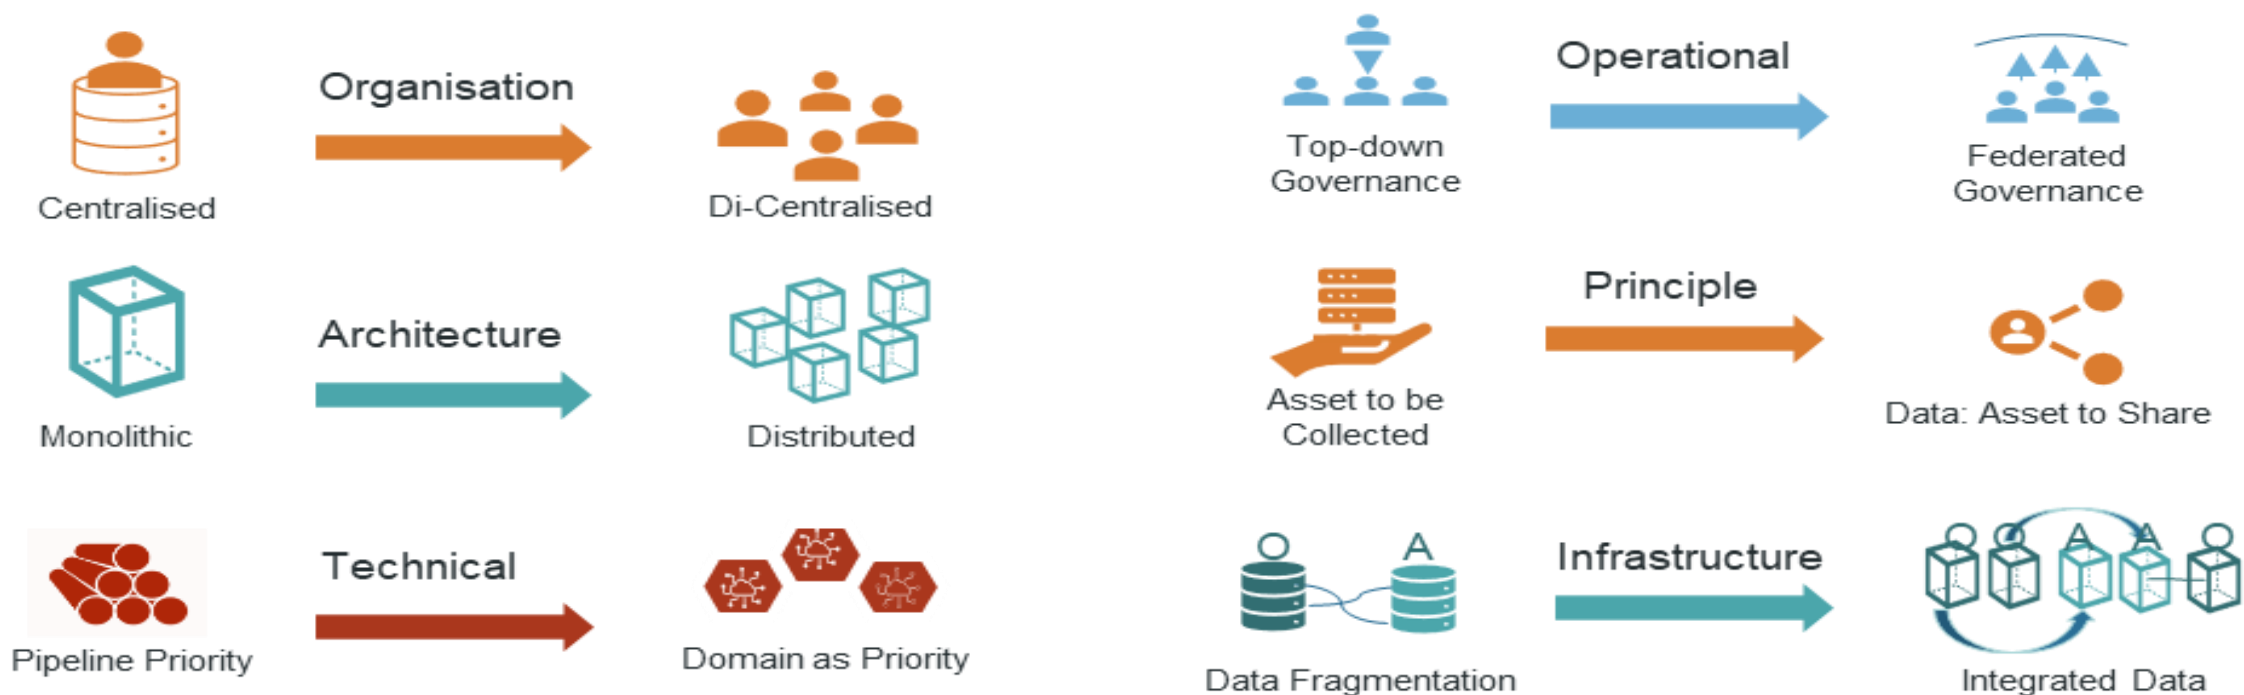

State

- State introduces a 3rd dimension to data handling ... Time
- The Standard request / response model is inherently stateless

Scalability

- Request / Response is inherently unable to scale exponentially
- Streams are distributed by design and do not suffer from request congestion

We must change the way we think and behave when it comes to Data

high volume real-time, accurate data → efficient in time and cost

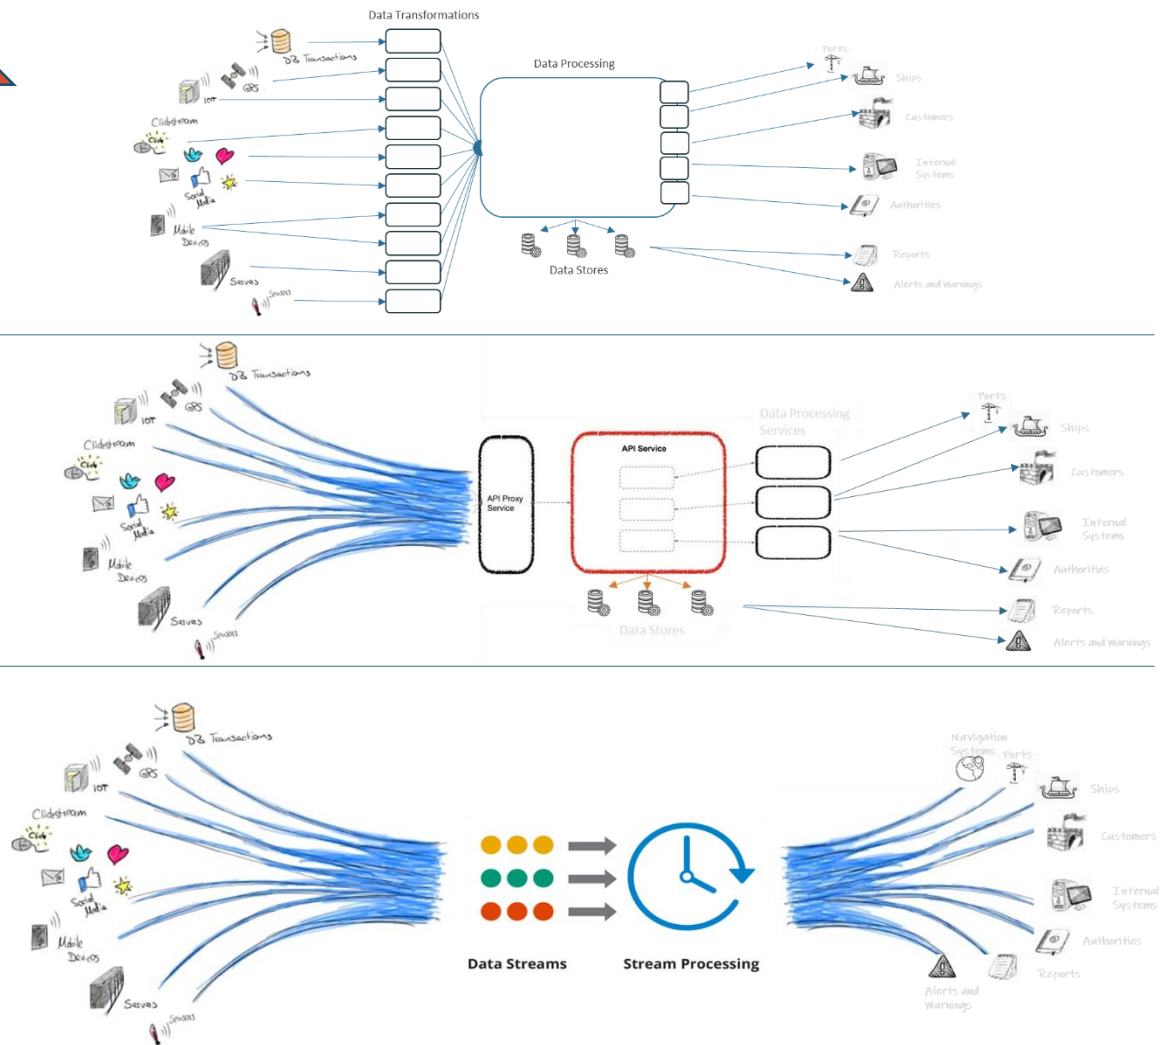

EDI is the oldest form of information exchange and is very rigid, costly & complex to maintain

APIs are a very common mechanism for easily exchanging data with low risk and have been used since the turn of the century

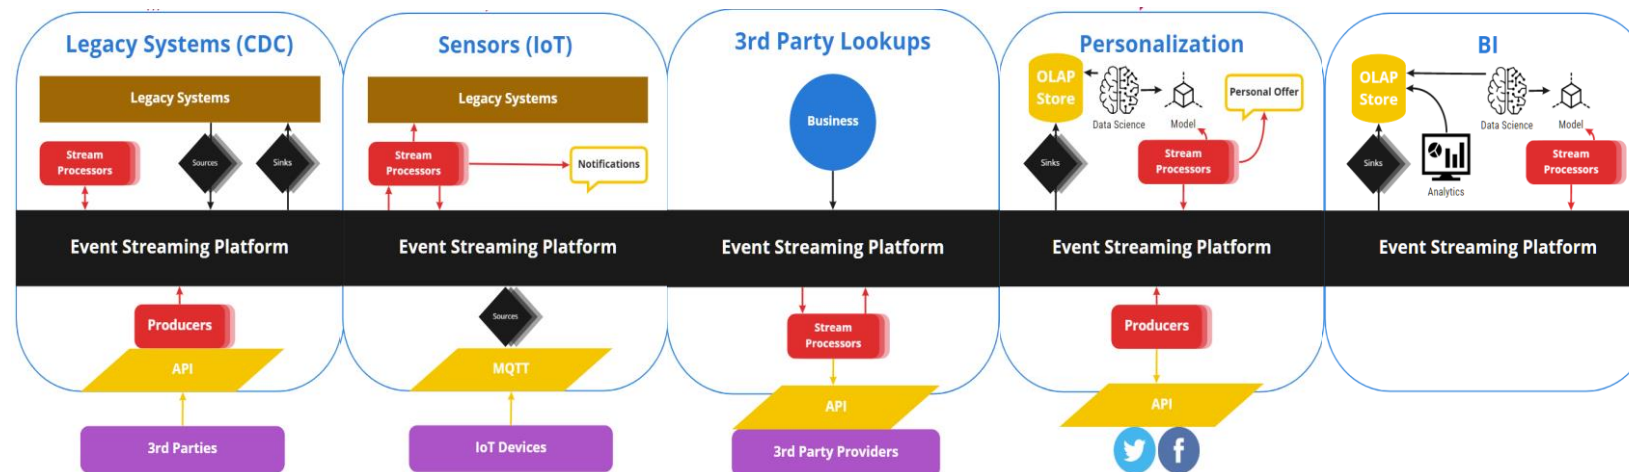

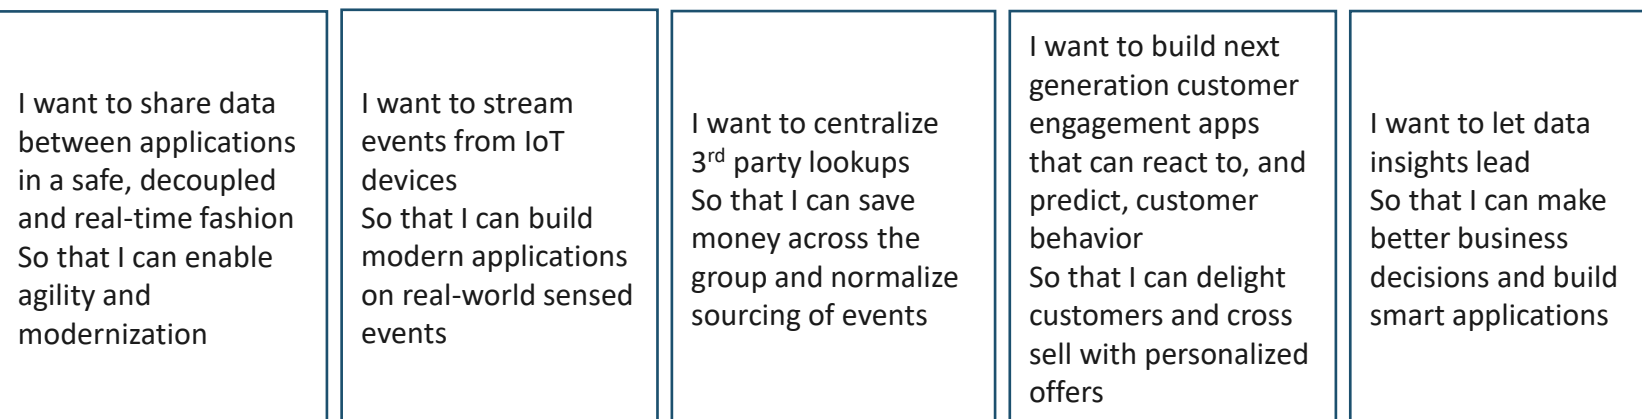

Data Streaming is the modern approach to data transport and ubiquitous sharing and enables a modern data architecture which stimulates data derived value

- Near-real time
 - Time consuming to change
 - Low scalability and Low extendibility
 - Limited Volume handling capability
 - Loosely coupled
- Near-real time
 - moderate to change
 - Extreme scalability and moderate extendibility
 - Linear Volume handling capability
 - Semi-decoupled
 - Stuck with same Request/Response problems
- Real time
 - Easy to change
 - Extreme scalability and extendibility
 - Exponential Volume handling capability
 - Decoupled

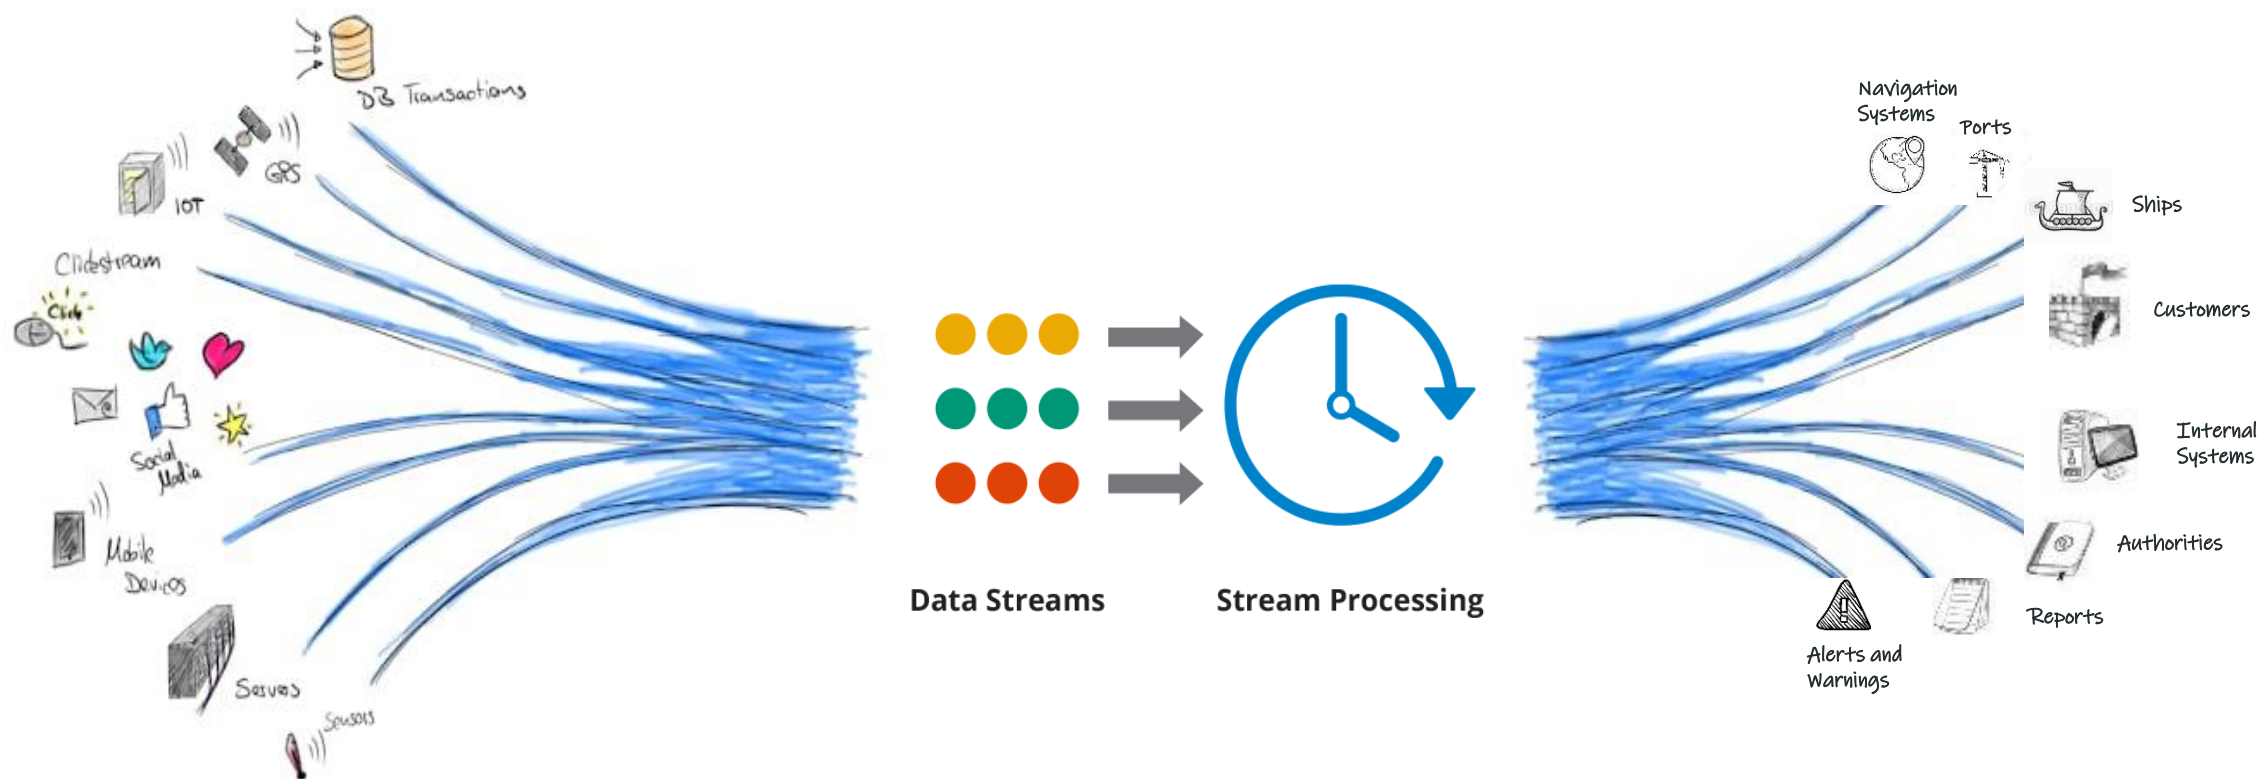

Complexity & Time to Integrate

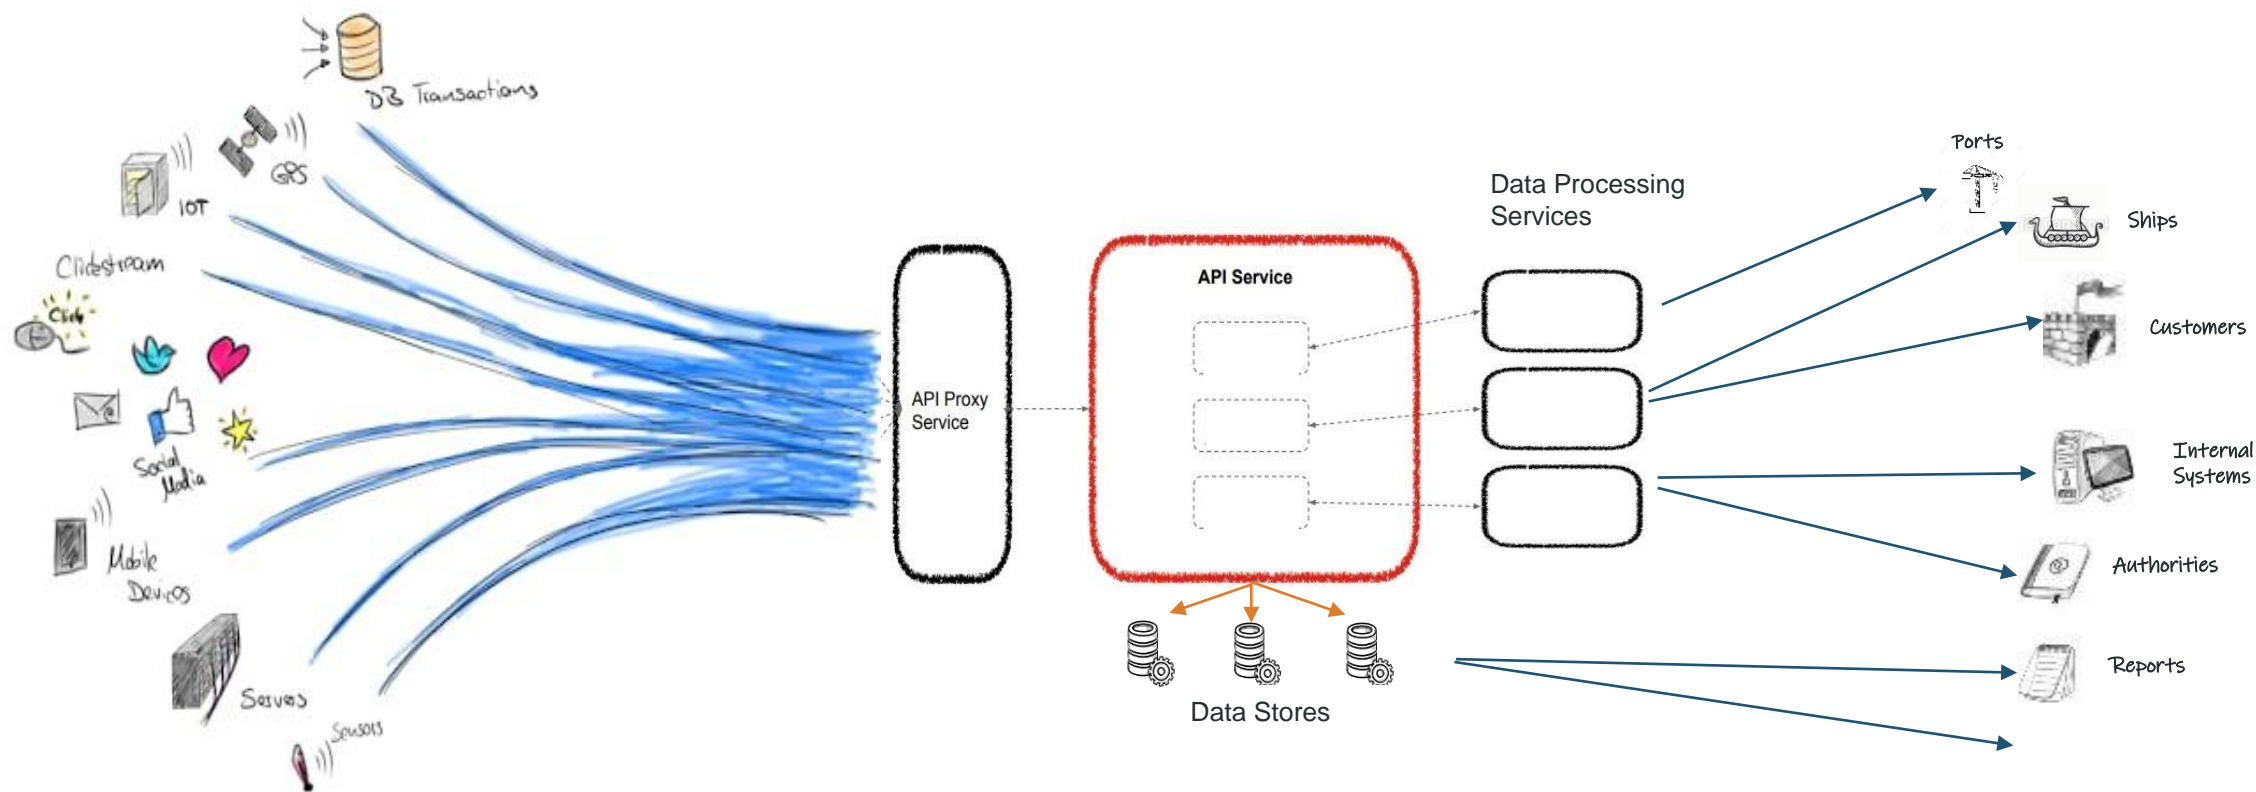

A streaming data paradigm enables business value across several domains

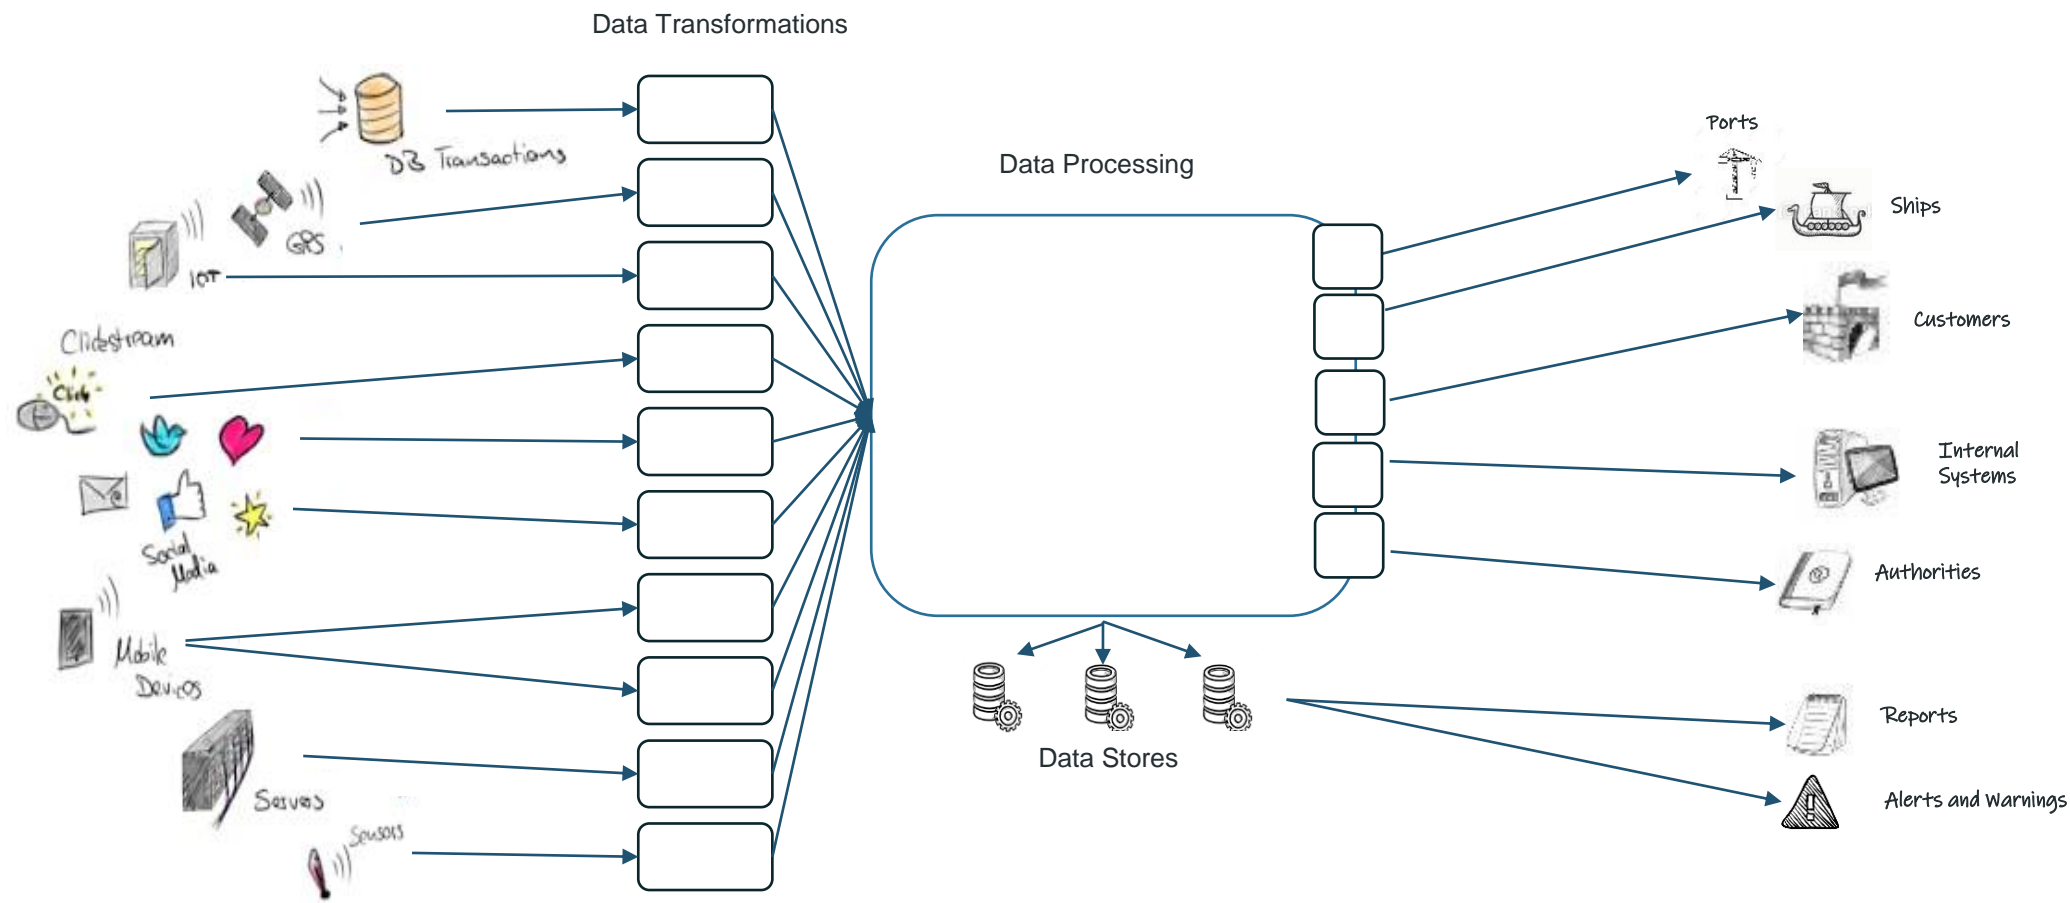

Data Streaming is the modern approach to data transport and ubiquitous sharing and enables a modern data architecture which stimulates data derived value

APIs are a very common mechanism for easily exchanging data with low risk and have been used since the turn of the century

EDI is the oldest form of information exchange and is very ridged, costly & complex to maintain

SECTION 02

What next for the SMDG

EDI is not going away, but we don't have to ignore advances that can improve the timeliness, visibility and accuracy of our data and the data we share with partners

IBM believes that EDI in its various formats will remain highly useful and widely used in its established areas for years to come, however, it **will not** be the primary tool to **solve new challenges** in supply chain that require more than a typical B2B document exchange. They see the **true future** lying in using and evolving B2B integration alongside **disruptive technologies** such as Streaming, IoT, blockchain and AI, to deliver **innovative levels of multi-party supply chain collaboration**

Starting simple and prove value while everyone becomes familiar with the new technology

EDI works really well, no immediate value driver to change

Opportunity to transform the industry though real time data streaming

2023 Sailing Schedule

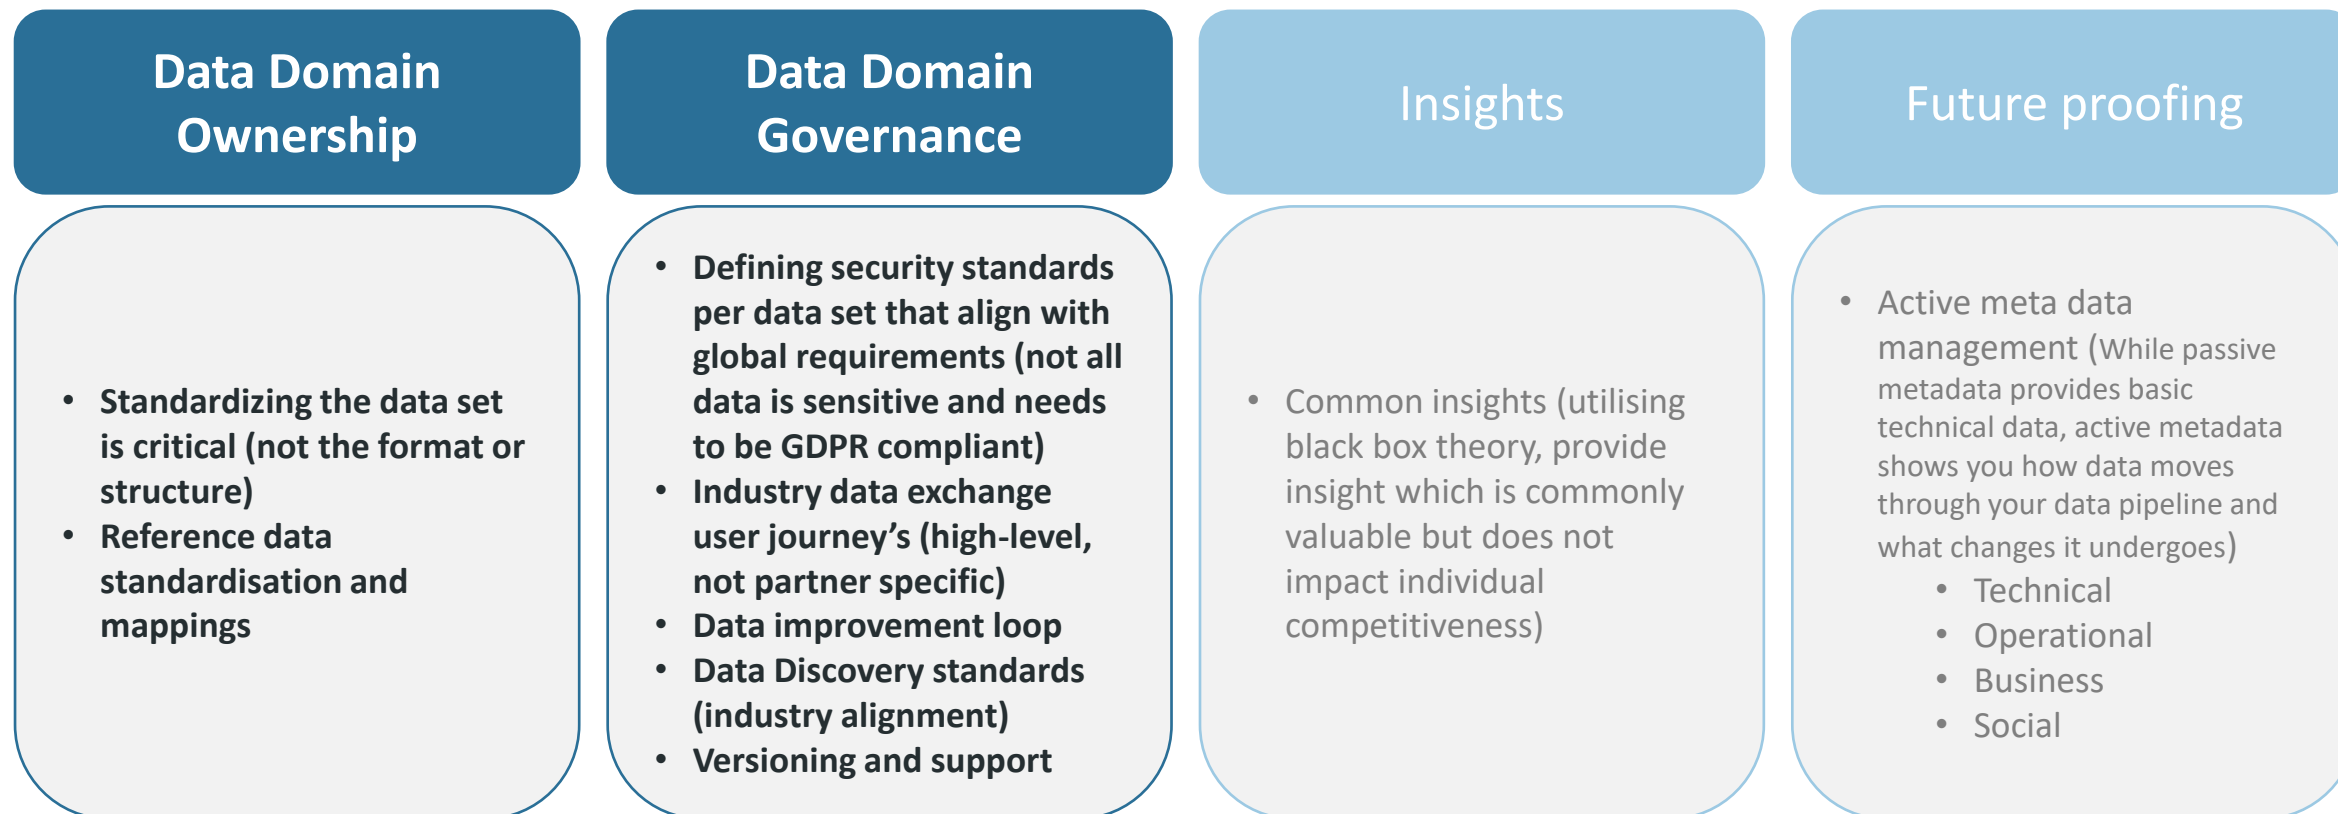

Year	Start	End	Month	Day	Time	Port
Year 5230	01/01	01/31	January	1	08:00	Port A
Year 5231	02/01	02/28	February	1	08:00	Port B
Year 5232	03/01	03/31	March	1	08:00	Port C
Year 5233	04/01	04/30	April	1	08:00	Port D
Year 5234	05/01	05/31	May	1	08:00	Port E
Year 5235	06/01	06/30	June	1	08:00	Port F
Year 5236	07/01	07/31	July	1	08:00	Port G
Year 5237	08/01	08/31	August	1	08:00	Port H
Year 5238	09/01	09/30	September	1	08:00	Port I
Year 5239	10/01	10/31	October	1	08:00	Port J
Year 5240	11/01	11/30	November	1	08:00	Port K
Year 5241	12/01	12/31	December	1	08:00	Port L

EDI still relies on a file to be generated and transmitted, received and translated.

While we can still leverage the structure of EDI documents within the API or stream context, even standard EDI structures have, in the shipping industry today, been customized to the extent that each translation is essentially fully customized

If standardizing formats and structures is not important, what is?

It depends on how much enablement responsibility SMDG wishes to take on ?
